International application No.
PCT/FR2004/001477

Box No. V Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

comprising a downwardly projecting central button, a circumferential bearing area (36) and an arched portion (40) therebetween provided with ribs (50) extending radially outwards from the central button and as far as the bearing area, characterised in that:

- the ribs (50) extend away from the central button and up to but not into the bearing area (36),
- the ribs (50) have a cross-section substantially parallel to the container axis (A) and extend continuously away from one another, and
- the ribs (50) have a curved longitudinal outline, and the bottom walls of the ribs in the region thereof that is adjacent to the central button rise higher than the base of said central button and the bottom walls and ridges of said ribs, in the regions thereof that are adjacent to the bearing area, and have curvatures that gradually merge into a continuous curved surface with no break in the curvature thereof immediately above the bearing area, in such a way that the bearing area is substantially planar and continuous over the entire length thereof, whereby the rigidity of the bottom wall can be increased while reducing the thickness thereof even in the
- 2.2 It follows that the subject matter of claim 1 differs from the teachings of D1 in that:
  - the ribs are dihedral and have a V-shaped crosssection with a mid-plane, and

bearing area.

International application No.
PCT/FR2004/001477

Box No. V Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

- the central button is in the form of a downwardly projecting circular plate.

The problem that the present invention is intended to solve can thus be considered to be that of minimising the influence of production tolerances on the mechanical strength and flatness without increasing the thickness of the bottom wall.

The central button in the form of a downwardly projecting circular plate enables the bottom wall to be stabilised and to impart a constant geometrical shape thereto regardless of the exact location of the pellet of crystallised material resulting from the process of injection moulding the parison, thereby enhancing the flatness of the bearing area.

No such button shape or similar shape having the same advantages is disclosed, in its present form, in the documents cited in the search report.

Since the use of these features is not found in or obvious from the prior art, the solution to the stated problem, as proposed in claim 1 of the present application, is considered to involve an inventive step (PCT Article 33(3)).

Claims 2 to 4 are dependent on claim 1 and thus also comply, as such, with the requirements of novelty and inventive step of the PCT.
